

# ANAMEKA™ FODDER SHRUB

**NOT JUST YOUR ORDINARY SALTBUSH**

## Why Anameka™?

Anameka™ is the elite strain of Old Man Saltbush, developed in WA by CSIRO. With increased palatability and an increase in abundant biomass (an average of 6kg per plant per year), at a more accessible level to stock – it is no wonder the demand for Anameka™ is quickly gaining momentum.

Anameka™ is a Summer active plant- reducing Summer feed costs and aiding pre-pasture establishment. Anameka™ is a fantastic tool to fill the late Summer to early Winter feed gap period.

Anameka™ is a valuable source of essential minerals and works extremely well with inter-row cropping pasture systems.

Anameka™ should be kept at a grazeable level to get the best out of the plants. Ideally, the more it is grazed, the better results you will see. The best sugars and nutrients are in the fresh growth, so regular grazing will see the most value in livestock.

Anameka™ also provides valuable protection over lambing season and also post-shearing in the colder months. Contact us today to discuss the best planting situations for your system.
