

Contract Planting Services

What can we offer?

With the capacity to plant up to 12,000 seedlings in one day- this is an extremely cost effective and efficient way of planting larger quantities of trees, shrubs and Anameka™. We work with all clients closely to ensure adequate ground preparation is undertaken, and we plant during the Winter season to take advantage of more favourable planting conditions.

Why does it work so well?

Our tow behind planting machine is effectively a one pass unit. It is fully adjustable, and scalps away any weed burden/organic matter, deep rips, plants and packs down seedlings for a better establishment result. It leaves a water harvesting furrow to direct rainfall and water to the plants root zone, for faster root growth and plant establishment.

So what are the basics?

Minimum numbers apply. Required ground preparation can vary depending on your soil, location and the season. We work closely with all clients to ensure you get the best results possible. We recommend to be prepared to manually water your seedlings if a rain event does not occur post-planting. With many clients and projects- we can't always time your project with the weather, but always do our best to help you achieve the best establishment possible. We can offer dry-hire water cart services as well. Planting timing is subject to change and weather conditions.

All clients must provide a manned, minimum 100hp FWA tractor for planting. Our planting calendar fills fast due to high demand and our seasonal window. Get in touch if you want to learn more.
